INMOBI advertising

Signal Your Way to Success

Elevate app addressability and maximize ad monetization with Publisher-Passed Signals, a privacy-safe feature on the InMobi SDK.

Publishers are sitting on a **goldmine of first-party signals** and are only beginning to unlock its full potential. These signals are essential in powering user acquisition (UA), analytics, attribution, and measurement. However, their application in ad monetization has been underutilized, leaving massive revenue opportunities untapped.

Publisher-Passed Signals (PPS), a feature of the InMobi Advertising SDK, enables publishers to securely share first-party data with minimal implementation effort, strengthening **supply representation, bid efficiency, and ad revenue**. Let's understand it with an example.

EXAMPLE

Signal	Implication	Benefits
User making "in-app purchases"	Longer sessions Higher engagement Progress in the game	Personalized content Higher wins & spends Higher revenue

Existing InMobi SDK integration

No personally identifiable information (PII) used

No additional addendums required

To get started with Publisher-Passed Signals, refer to the integration guide on the InMobi Support Portal.

Here are the the different categories of **Publisher-Passed Signals** the InMobi SDK supports:

A) Auction-Level Signals

Signal	Value	Relevance
Avg. clearing price last n auctions	e.g.,3.20	Provides a stronger estimate for floor price to win the bidding auction.
User ctr	e.g., 0.12	Implies user is highly interested in the game and is well-suited for video campaigns.

B) Session-Related Signals

Signal	Value	Relevance
Impression depth	Int, e.g., 1000	Implies the total number of ads user has seen in lifetime.
Session depth	Int, e.g., 12	Implies the total number of ads user has seen in the session.
Ad user cohort	minnow/ dolphin/shark/ whale	Based on the number of full-screen or rewarded ads seen by the user.

C) User Behavioural Signals

Signal	Value	Relevance
Acquisition type	organic, paid	Indicates user has tendency to download apps through ads.

D) App-Related Signals

Signal	Relevance
Content	Granular topic classification of the content using IAB Taxonomy, useful for contextual targeting.
Category	Broad app classification from app stores (e.g., Games, News), useful for genre-level targeting.
Language	ISO-639-1 language code of the content (e.g., en), helps ensure language-appropriate ads.
Context	Format of the content (e.g., game, video, text), informs creative and format alignment.
Content Rating	Age/maturity rating (e.g., MPAA), supports brand safety and suitability.
Keywords	Comma-separated descriptive terms, useful for contextual and interest-based targeting.
